Weekly Progress Report

Name: Neelima Cheemala

Domain: Python/ Web Development

Date of submission: May 25, 2026

Week Ending: 02

I. Overview

This week, the primary focus was on learning advanced Java Object-Oriented Programming concepts from the J2SE1 training sessions and applying these concepts to the Food Delivery System project selected from the internship project list. The sessions covered inheritance, abstraction, encapsulation, polymorphism, abstract classes, interfaces, and method overriding concepts. These topics helped in understanding the structure and workflow of the Food Delivery System project.

II. Achievements

1. Advanced Java Learning:

- Learned inheritance and its types in Java.
- Understood abstraction, encapsulation, and polymorphism concepts.
- Practiced method overloading, overriding, interfaces, and abstract classes.
- Learned the use of super and final keywords

2. Food Delivery System Project:

Name of the Project: Food Delivery System

- Understood the workflow of the Food Delivery application.
- Studied modules such as restaurant management, customer ordering, delivery tracking, and payment system.
- Identified classes and objects required for the project such as Customer, Restaurant, Menu, Order, and Delivery Agent.
- Connected Java OOP concepts with real-time project implementation.

3. Practical Understanding:

- Improved understanding of how inheritance and encapsulation can be used in project modules

- Discussed project structure and implementation ideas with mentors and team members.
- Enhanced problem-solving and logical thinking skills through Java examples.

III. Challenges

1. Java OOP Concepts:

- Faced initial difficulty understanding interfaces and abstraction concepts.
- Required additional practice for implementing polymorphism and inheritance.

2. Project Design:

- Encountered challenges while mapping Java concepts to the Food Delivery System workflow.
- Worked on understanding relationships between classes and project modules.

IV. Learning Resources

1. J2SE1 Learning Materials:

- Used J2SE1 PPT presentations and Java notes for learning advanced concepts.
- Referred to Oracle Java documentation and online tutorials for additional practice.

2. Internship Project Resources:

- Studied the Food Delivery System project requirements from the internship project document.
- Explored sample food delivery application workflows and online references.

V. Next Week's Goals:

1. Java Programming:

- Practice advanced Java programs using interfaces, abstraction, and polymorphism.
- Improve implementation skills through hands-on coding exercises.

2. Food Delivery System Development:

- Start designing project modules and class structures.
- Work on user login, restaurant listing, menu display, and order management modules.
- Continue applying Java OOP concepts in project development.

VI. Additional Comments

This week provided better understanding of advanced Java programming concepts and their practical usage in the Food Delivery System project. The combination of theoretical learning and project discussion improved confidence in software development and project planning.

Weekly Progress Report

Name: Neelima Cheemala

Domain: Python / Web Development

Date of Submission: 11 June 2026

Week Ending: 03

I. Overview:

This week, the primary focus was on learning advanced Java 8 features and JDBC concepts from the J2SE5 and J2SE6 training sessions. The sessions provided understanding of backend development, database connectivity, and efficient database handling techniques required for the Food Delivery System project. These topics helped in understanding the structure and workflow of the Food Delivery System project.

II. Achievements:

1. Java 8 Features Learning:

- Learned Lambda Expressions and their role in functional programming.
- Understood Method References and Functional Interfaces.
- Studied Stream API for collection processing and data handling.
- Learned Default Methods, Collectors Class, and Optional Class.
- Explored Java Date and Time API including Local Date, Local Time, and Local Date Time.

2. JDBC Learning:

- Understood JDBC architecture and JDBC API concepts.
- Learned different JDBC Statement objects such as Statement, PreparedStatement, and CallableStatement.
- Studied limitations of Simple Statement and advantages of PreparedStatement.
- Practiced database connectivity and SQL query execution.
- Understood query optimization and secure database communication using PreparedStatement.

3. Food Delivery System Project:

Name Of the Project : Food Delivery System

- Connected Java 8 concepts with backend development requirements.
- Understood how JDBC can be used for customer, restaurant, menu, and order database management.
- Discussed implementation of login validation, order management, and payment handling modules.
- Improved understanding of database design and project workflow integration.

III. Challenges:

1. Java 8 Concepts:

- Faced difficulty understanding Stream API operations and Optional Class implementation.
- Required additional practice with Lambda Expressions and Functional Interfaces.

2. JDBC Concepts:

- Encountered challenges while understanding PreparedStatement syntax and query parameter handling.
- Faced difficulty in mapping project modules with relational database tables.

3. Project Integration:

- Worked on understanding relationships between customer, restaurant, menu, and order modules.
- Practiced integrating backend logic with database operations.

IV. Learning Resources:

1. J2SE5 & J2SE6 Learning Materials:

- Referred to J2SE5 and J2SE6 PPT presentations for Java 8 and JDBC learning.
- Used Java documentation, coding examples, and online tutorials for additional practice.

2. Project Resources:

- Studied Food Delivery System project workflow and database requirements.
- Practiced backend implementation examples related to JDBC connectivity and database handling.

V. Next Week's Goals:

1. Java & JDBC Practice:

- Practice advanced Java 8 coding exercises using Streams and Lambda Expressions.
- Implement JDBC CRUD operations using Prepared Statement.

2. Food Delivery System Development:

- Design and implement database tables for project modules.
- Work on customer login, restaurant listing, menu display, and order management functionalities.
- Integrate database connectivity with backend project modules.

VI. Additional Comments:

These weeks provided practical understanding of Java 8 programming and advanced JDBC concepts. The knowledge gained helped strengthen backend development skills and improved confidence in implementing the Food Delivery System project.

Weekly Progress Report

Name: Neelima Cheemala

Domain: Full Stack Web Development Date of Submission: 19 June 2026

Week Ending: 04

I. Overview:

This week, the primary focus was on learning Full Stack Web Development concepts and understanding how these technologies can be applied to the Food Delivery Application project. The learning sessions covered front-end development, back-end development, databases, web frameworks, MEAN stack architecture, and HTML fundamentals. These concepts helped in understanding how a complete food delivery platform can be designed and developed using modern web technologies.

II. Achievements:

1. Full Stack Web Development Learning:

- Learned the concept of Full Stack Development and its importance in modern web application development.
- Understood the responsibilities of front-end and back-end developers.
- Explored the role of HTML, CSS, JavaScript, databases, servers, and frameworks in web development.
- Studied how client-side and server-side components interact to create dynamic web applications.

2. Front-End Development Concepts:

- Learned the basics of front-end development and user interface design.
- Understood the use of HTML, CSS, and JavaScript in building responsive web pages.
- Studied how layouts, buttons, forms, images, and navigation menus improve user interaction.

- Analyzed how these concepts can be used in customer registration, restaurant listing, and food ordering pages.

3. Back-End Development Concepts:

- Learned how back-end systems process user requests and manage application logic.
- Understood the role of databases in storing customer, restaurant, and order information.
- Explored server-side technologies and request-response mechanisms.
- Studied database management concepts and their importance in large-scale applications.

4. MEAN Stack Architecture:

Project Name: Food Delivery Application

- Studied the MEAN Stack components: MongoDB, Express.js, AngularJS, and Node.js.
- Understood how MongoDB can store restaurant details, menu information, customer profiles, and order history.
- Learned how Express.js and Node.js can be used to handle APIs and business logic.
- Explored AngularJS for developing interactive user interfaces.
- Identified how the MEAN stack can be used as a complete technology solution for the Food Delivery Application.

5. HTML Fundamentals and Practice:

- Learned HTML document structure including DOCTYPE, HTML, HEAD, and BODY tags.
- Studied HTML elements, tags, and attributes.
- Practiced creating basic web pages using headings, paragraphs, links, and images.
- Understood how HTML forms can be used for user registration, login, and order placement.

- Developed simple webpage layouts to improve practical understanding.

6. Food Delivery Project Planning:

- Analyzed major project modules including customer management, restaurant management, menu management, cart functionality, payment processing, and delivery tracking.
- Identified the information flow between customers, restaurants, and delivery agents.
- Prepared a preliminary architecture showing interactions between frontend, backend, and database components.
- Discussed possible implementation approaches using Full Stack technologies.

III. Challenges:

1. Understanding Full Stack Integration:

- Faced difficulty understanding how frontend, backend, and databases communicate with each other.
- Required additional study to understand API interactions and server-side processing.
- Spent extra time exploring the request-response cycle in web applications.

2. MEAN Stack Learning Curve:

- Encountered challenges in understanding the role of each MEAN stack component.
- Required additional tutorials and documentation to understand real-world implementation scenarios.
- Worked on connecting theoretical concepts with practical project requirements.

3. Food Delivery Project Design:

- Faced challenges while planning database structures for restaurants, customers, orders, and delivery tracking.

- Required detailed analysis to identify relationships between different project modules.
- Explored various design approaches to improve scalability and maintainability.

IV. Learning Resources:

1. Full Stack Web Development Course Reader:

- Studied Full Stack Development concepts including front-end and back-end technologies.
- Learned about databases, frameworks, and server-side architecture.
- Explored MEAN stack components and their practical applications.
- Practiced HTML fundamentals, tags, attributes, and document structure.

2. Online Learning Resources:

- Referred to web development tutorials and technical documentation.
- Watched video lectures related to Full Stack Development and MEAN stack technologies.
- Practiced HTML examples and beginner-level web application development exercises.
- Used online coding resources to strengthen practical understanding.

V. Next Week's Goals:

1. Front-End Development:

- Create user registration and login pages using HTML and CSS.
- Design restaurant listing and menu display interfaces.
- Improve webpage structure and responsiveness.

2. Back-End Planning:

- Design database schemas for customers, restaurants, menus, and orders.
- Learn API development concepts using Node.js and Express.js.
- Explore MongoDB database operations.

3. Food Delivery Project Development:

- Begin implementation of core project modules.
- Integrate frontend forms with backend processing.
- Continue planning payment and delivery tracking functionalities.

VI. Additional Comments:

This week significantly improved my understanding of Full Stack Web Development concepts and their practical application in the Food Delivery Application project. Learning about front-end technologies, back-end processing, databases, HTML fundamentals, and MEAN stack architecture provided a strong foundation for future development activities. The knowledge gained during this week will be highly beneficial for implementing a scalable and user-friendly food delivery platform.
